JANUARY 2006

INVESTIGATION OF TURKEY'S CARBON DIOXIDE PROBLEM
BY NUMERICAL MODELING

A THESIS SUBMITTED TO
THE GRADUATE SCHOOL OF NATURAL AND APPLIED SCIENCES
OF
MIDDLE EAST TECHNICAL UNIVERSITY

BY
ALİ CAN

IN PARTIAL FULFILLMENT OF THE REQUIREMENTS
FOR
THE DEGREE OF DOCTOR OF PHILOSOPHY
IN
ENGINEERING SCIENCES

JANUARY 2006

Approval of the Graduate School of Natural and Applied Sciences

Prof.Dr.Canan ÖZGEN
Director

I certify that this thesis satisfies all the requirements as a thesis for the degree of Doctor of Philosophy.

Prof.Dr. Turgut TOKDEMİR
Head of Department

This is to certify that we have read this thesis and that in our opinion it is fully adequate, in scope and quality, as a thesis for the degree of Doctor of Philosophy.

Prof. Dr. Aysel T. ATIMTAY
Co-Supervisor

Prof.Dr.Turgut TOKDEMİR
Supervisor

Examining Committee Members

ABSTRACT

INVESTIGATION OF TURKEY'S CARBON DIOXIDE PROBLEM BY NUMERICAL MODELING

CAN , Ali

Ph.D., Department of Engineering Sciences
Supervisor: Prof. Dr. Turgut TOKDEMİR
Co-Supervisor: Prof. Dr. Aysel ATIMTAY

January 2006, 238 pages

CO₂ emission is very important, because it is responsible for about 60% of the “Greenhouse Effect”. The major objectives of this study were to prepare a CO₂ emission inventory of Turkey based on districts and provinces by using the fuel consumption data with respect to its sources, to find the CO₂ uptake rate of forests in Turkey based on provinces and districts, and to estimate the ground level concentrations of CO₂ across Turkey using U.S. EPA's ISCLT3 model for the preparation of ground level concentration maps. The basic sources of the CO₂ emission were taken as households, manufacturing industries, thermal power plants and road vehicles. The sinks of the CO₂ were forests. The CO₂ uptake by forests was calculated using the annual increment of forest biomass.

The results of the CO₂ emission inventory conducted in this study between the years 1990 and 2003 showed that the CO₂ emission in 1990 was 142.45 million tones/year and the highest emission was calculated in 2000 with a value of 207.97 million tones/year.

The regional distribution of CO₂ emissions showed that the Marmara Region emits the highest regional CO₂ emission throughout the years with an

average value of 54.76 million tones/year. It was also concluded that Marmara and Aegean Regions are responsible for half of the CO₂ emission of Turkey.

The results of the CO₂ uptake calculations showed that the CO₂ uptake of forests in the coastal zone was higher than that in the inland zone. The CO₂ uptake in the Central Anatolia, Eastern Anatolia and South-Eastern Anatolia regions were 2.6, 1.9 and 1.1 million tons/year, respectively. The maximum CO₂ uptake is in the Black Sea region with a value of 16.4 million tons/year.

The highest ground level CO₂ concentrations without any sink effect were always obtained in the Marmara Region. However, the forest areas in this region decrease the concentrations considerably.

The dispersion model performance is determined highly without the result of the year 2002.

Keywords: Emission Inventory, Sink, Source, ISCLT3 Dispersion Model, IPCC Methods, CO₂ Emission, CO₂ Uptake

CO₂ emisyonu, Sera Gazı Etkisinin yaklaşık %60'ına sebep olmasından dolayı oldukça önemlidir. Bu çalışmanın en önemli hedefi ise, emisyon kaynaklarına göre yakıt tüketimlerini kullanarak il ve ilçe düzeyinde Türkiye CO₂ emisyon envanterini hazırlamak, il ve ilçe düzeyinde Türkiye ormanlarının CO₂ soğurmasını bulmak ve U.S. EPA ISCLT3 modeli kullanarak Türkiye'deki yer seviyesi CO₂ konsantrasyonu, konsantrasyon haritaları hazırlayabilmek için tahmin etmektir. CO₂'in en önemli kaynakları, haneler, imalat sanayii, termik santraller ve ulaşım araçları olarak ele alınmıştır. CO₂'i soğurma mekanizmaları ise ormanlardır. Ormanlardaki CO₂ soğurması yıllık biokütle artışları kullanılarak hesaplanmıştır.

Bu çalışmadaki, 1990 ve 2003 yılları arasına ait CO₂ emisyon envanter sonuçları, en düşük CO₂ emisyon değerinin 1990 yılında 142.45 milyon ton ve en yüksek değer ise 2000 yılında 207.97 milyon ton olarak hesaplandığını göstermiştir.

Yıllar itibariyle en yüksek bölgesel CO₂ emisyonu, Marmara Bölgesinden ortalama 54.76 milyon ton/yıl olarak yayılmıştır. Ayrıca, Marmara ve Ege Bölgelerinde, Türkiye CO₂ emisyonunun yarısının atıldığı da tespit edilmiştir.

CO₂ soğurma hesaplarından elde edilen sonuçlara göre, kıyı bölgelerde ormanlar tarafından soğurulan CO₂, iç bölgelere göre daha yüksektir. İç Anadolu, Doğu Anadolu ve Güneydoğu Anadolu Bölgelerinde, CO₂ sırasıyla 2.6, 1.9 ve 1.1 milyon ton/yıl olarak soğurulmuştur. Karadeniz Bölgesinde CO₂ soğurması 16.4 milyon ton/yıl olarak maksimumdur.

Yer seviyesindeki soğurma olmaksızın, en yüksek CO₂ konsantrasyonu Marmara Bölgesinde elde edilmiştir. Ormanlar konsantrasyonu önemli ölçüde düşürmüştür.

Model dağılım performasının 2002 yılı verisi olmaksızın daha yüksek olduğu tespit edilmiştir.

Anahtar Kelimeler: Emisyon Envanteri, Soğurma, Kaynak, ISCLT3 Dağılım Modeli, IPCC Metodu, CO₂ Emisyonu, CO₂ Konsantrasyonu

PREVIEW

To My Parents

ACKNOWLEDGMENTS

I wish to acknowledge my deep sense of profound gratitude to my supervisor, Prof. Dr. Turgut TOKDEMİR for his illuminating and inspiring guidance and continuous encouragement throughout the course of the study.

I am deeply grateful to my co-supervisor Prof. Dr. Aysel ATIMTAY for her endless encouragement, supervision, suggestions, comments and sincere guidance.

Deep appreciations are extended to Prof. Dr. Kahraman ÜNLÜ and Assoc. Prof. Dr. Ahmet ERASLAN for being in my thesis review committee and for constructive criticism and valuable suggestions throughout the course of this study. Thanks are also extended to Assist.Prof.Dr.Ayşegül LATİFOĞLU from Hacettepe University.

I am beholden to my father, Bayram CAN, my mother, Esma CAN, my sister and sister in law, Aygül and Tanju ERDİ, and my brother and brother in law, Aytaç and Hazel CAN for their encouragement and support.

I would like to thank all my real friends in the Environmental Engineering Department and in the Engineering Science Departments.

I am grateful to my friend, Sevil UYGUR for her providing me his continuous help and valuable suggestions during this study.

Special thanks are due to Cenk BALÇIK and Cihan DÜNDAR for their endless support.

I extend my sincere thanks to my colleagues in the State Institute of Statistics.

The whole remains incomplete, if I do not record my sincerest thanks to two special people, Bengisu ERDİ and Bertan CAN for their endless support during this study.

I am thankful to Dr. Muhammad Tahir CHAUDHARY for his encouragement.

Finally, I wish to express my sincere thanks to Zehra ÜNAL for her valuable support.
